Protac 2822 Screw Lock

Product description

Protac 2822 Screw Lock is a fast cure, low strength anaerobic threadlocker. The product cures when confined in the absence of air on close-fitting metal surfaces.

Specification

Meets Military specifications: MIL-S-46163 Type II Grade M.

Typical applications

Protac 2822 is formulated to lock all metric and imperial nuts and screws, preventing vibration loosening and leakage through the threads. Protac 2822 is slightly oil tolerant, so it will bond some 'as received' parts, but best results are obtained with clean substrates. The thixotropic nature of the product prevents run off, dripping and migration after assembly. Protac 2822 is typically used on mounting housing screws. Protac 2822 prevents corrosion of assembled parts.

Properties of material

Chemical type	Di-Methacrylate
Appearance	Purple
Specific Gravity	1.05
Viscosity cPs[1]	1,200
Viscosity cPs[2]	5,000
Breakaway Torque (N.m)[3]	4 -7
Typical	6
Prevailing Torque (N.m)[3]	2 - 8
Typical	4
Fixture Time[4]	≤15
Full Cure @20°C (hours)	24
Flash Point (°C)	>100
Shelf Life @ 20°C (months)	24
Max Gap Fill (mm)	0.25
Operating Temp Range (°C)	-50 to +150

1Brookfield RVT, spindle 3, 20rpm
3 On M10 black oxide steel bolt and M10 bright steel nut, ISO10964
4 ISO 10964

Typical curing speed, % of final strength:-
15 mins Finger tight
1 hour~ 70% strength
24 hours 100% strength

Cure speed vs. substrate

Cure speed and strength vary according to the substrates. When used on mild steel and brass components anaerobic adhesives will reach full cure faster than more inert materials such as stainless steel and zinc dichromate. Protac AC32 activator may be used to accelerate cure speed

Cure speed vs. bond gap

The size of the bond gap greatly affects the speed of cure of anaerobic adhesives. Bond gap varies with thread type and size of the fastener.

Protac®
Engineering Adhesives, Industrial Sealants

The larger the gap between threads, the slower the cure speed. Maximum recommended gap for 2822 is 0.25mm

Cure speed vs. temperature

All figures relating to cure speed are tested at 22°C. Lower temperatures will result in slower cure. Heating the assembled parts accelerates the curing process. Activator AC32 should be used when the temperature is less than 5°C.

Typical environmental resistance

Hot strength

Protac 2822 is suitable for use at temperatures up to 150°C. At 130°C the bond strength will be ~30% of the strength at 21°C.

Heat ageing

Protac 2822 retains ~90% full strength when heated to 100°C for 90 days then cooled and tested at 22°C.

Chemical / Solvent Resistance

Protac anaerobics exhibit excellent chemical resistance to most oils and solvents including motor oil, leaded petrol, brake fluid, acetone, ethanol, propanol and water. Anaerobic adhesives are not recommended for use in pure oxygen or chlorine lines.

Chemical	**Temp.**	**% Initial Strength Retained**	
		500 hours	1000 hours
Acetone	22°C	100	80
Ethanol	22°C	100	100
Motor Oil	125°C	100	100
Petrol	22°C	100	100
Brake Fluid	22°C	100	100
Water/Glycol	87°C	90	85

General information

For safe handling of this product consult the Material Safety Data Sheet.

Anaerobic adhesives only cure in the absence of air and with metal part activation. Adhesive outside the joint will remain uncured and may be wiped away with a cloth.

Protac 2822 is suitable for most medium and coarse- threaded screws. Not recommended on certain plastics as stress cracking can sometimes result. Some anti-corrosion chemicals inhibit the cure system in this type of anaerobic. Trials are recommended to establish whether cleaning of the parts is necessary. AC32 Activator may be required on plated parts.

Directions for use

Ensure parts are clean, dry and free from oil and grease. Apply adhesive to all engaged threads. Assemble parts and allow to cure. Wipe excess adhesive from outside of joint.

Storage

Store in a cool area out of direct sunlight. Refrigeration to 5°C gives optimum storage stability.
